

Lead Source Capture SOP

Purpose:

Capture the lead source when a customer first enters the sales process so future lead-channel performance can be measured accurately.

When to Record the Lead Source

Record the lead source when the lead first comes in, before the estimate is created.

Do not wait until the job is sold.

Information to Record

For each new lead, record:

- **Lead source**
- **Contact method**
- **Lead created date**
- **Customer name and contact information**
- **Estimate ID once an estimate is created**
- **Final estimate status**
- **Job ID and revenue if the estimate becomes a job**

Lead Source vs. Contact Method

Lead source and contact method are not always the same.

Example:

A customer sees a Valpak advertisement and then calls the office.

- **Lead source: Valpak**
- **Contact method: Phone**

Do not replace the original lead source with Phone just because the customer called.

Source Naming

Use one standard name for each source.

For example, do not create separate versions such as:

- **Thumbtack**
- **Thumbtack Lead**

or:

- **Angi Lead**
- **Angi Leads**

If the source is unknown, use the agreed Unknown option instead of guessing.

Process

1. **Receive the new lead.**
2. **Ask or confirm how the customer originally found the company.**
3. **Record the lead source and contact method.**
4. **Create the estimate and keep the source connected to the opportunity.**
5. **Update the estimate to its final status.**
6. **If the estimate is sold, connect the job and revenue to the same opportunity.**

Target workflow:

Lead + Source → Estimate → Won/Lost → Job + Revenue

Why This Matters

Consistent lead-source tracking will make it possible to accurately compare:

- **Lead-to-sale conversion**
- **Estimate win rate**
- **Revenue per lead**
- **Revenue by channel**
- **Average job value by channel**

The goal is to make sure every lead channel is measured from the same starting point.
